IDC MarketScape Worldwide AI Coding and Software Engineering Technologies 2025

GitHub named a Leader for GitHub Copilot

IDC MarketScape vendor analysis model is designed to provide an overview of the competitive fitness of technology and suppliers in a given market. The research methodology utilizes a rigorous scoring methodology based on both qualitative and quantitative criteria that results in a single graphical illustration of each supplier's position within a given market. The Capabilities score measures supplier product, go-to-market and business execution in the short-term. The Strategy score measures alignment of supplier strategies with customer requirements in a 3-5-year timeframe. Supplier market share is represented by the size of the icons.

Plan Mode

Create, refine, and execute step-by-step implementation plans.

NEW

Kickstart spec-driven development with Spec Kit

Ask Mode

Fast, helpful, and focused entirely on answering your programming question without touching your code.

Edit Mode

Pick any number of files in your project to change and describe the update in natural language. Let Copilot apply inline, review-ready code edits.

Agent Mode

Have Copilot autonomously plan steps, select the right files, run tools or commands, and iterate on code edits until the task is complete.

← Less autonomous

More autonomous →

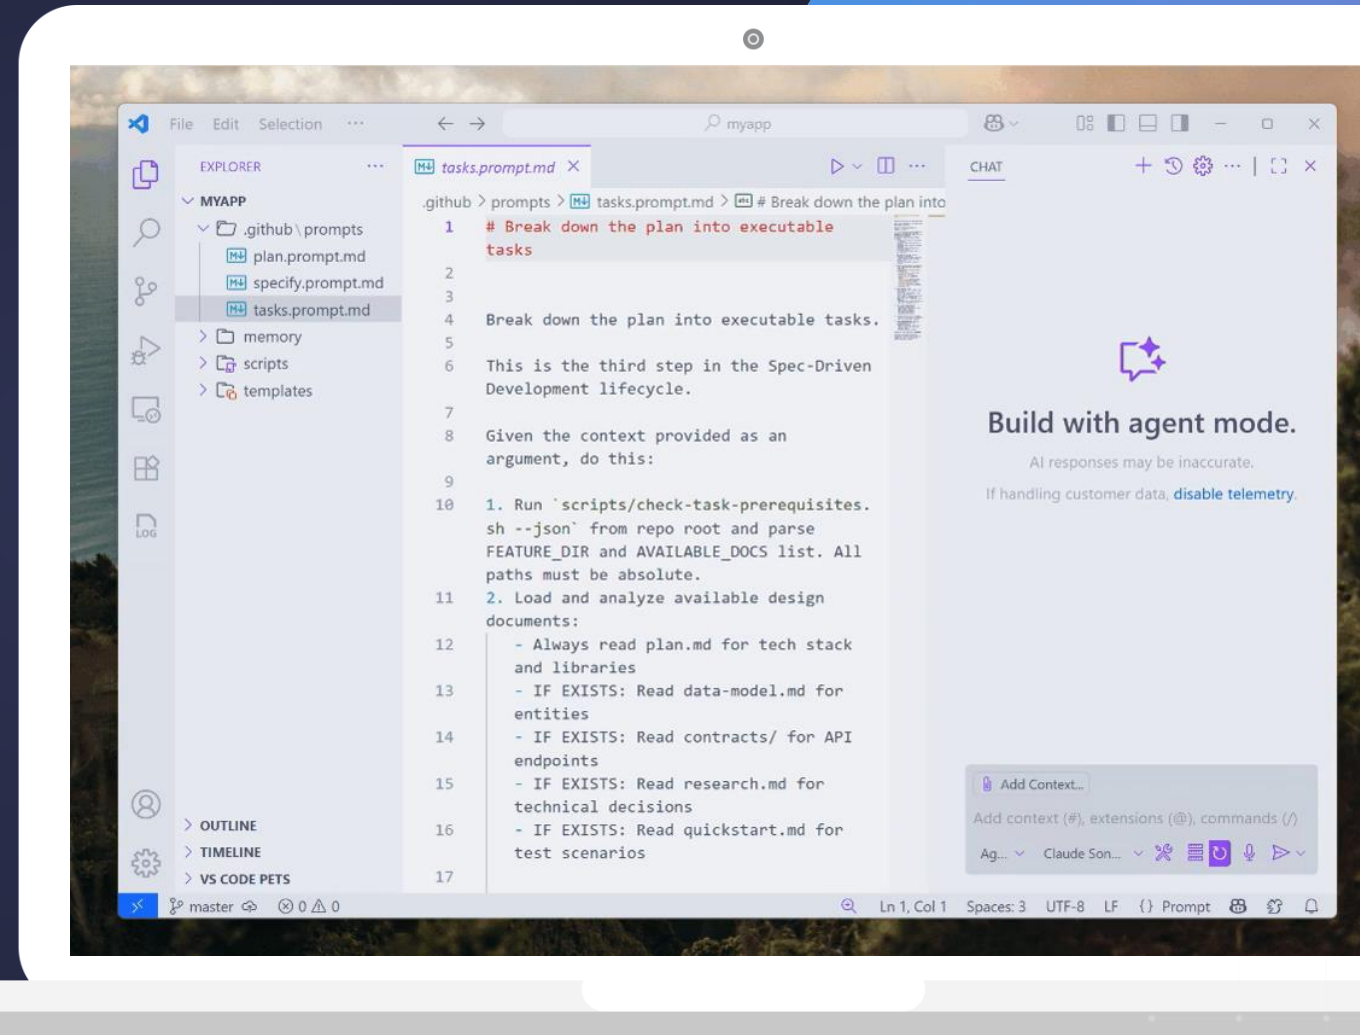

GitHub Copilot Spec Kit

GitHub's open-sourced toolkit for spec-driven development

Center GitHub Copilot's development on a structured process guided by treating specs as executable artifacts

Drive development through four gated validation checkpoints of Specify, Plan, Tasks, and Implement

Reflect and refine throughout each checkpoint to critique, spot gaps, and course correct at each step of the way

Copilot Spaces

 Generally Available

Turn GitHub Copilot into a project expert

✓ Ground GitHub Copilot in curated files, docs, pull requests, issues, and custom instructions for high-quality responses

✓ Centralize and scale expertise across the enterprise by sharing Spaces with teams and attaching directly to repositories

✓ Stay within a familiar workflow by accessing Spaces in the IDE via the GitHub MCP Server

Coding Agent

Generally Available

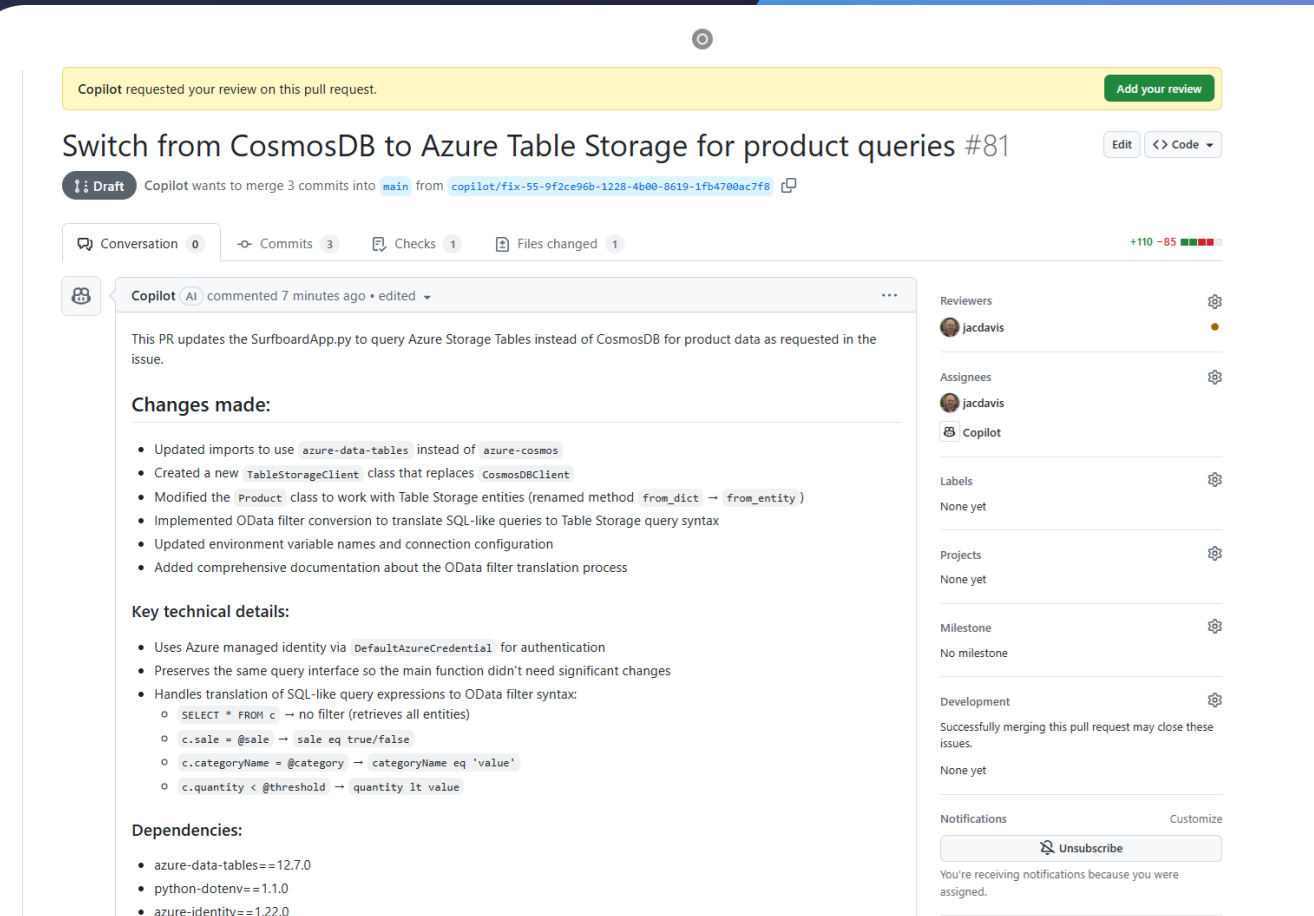

Agentic capability in GitHub to enhance team productivity like an AI teammate

Assign issues to GitHub Copilot and get back pull requests, automatically validated with tests and linters

Stay in control by working with Copilot and iterating through pull request reviews

Tailor to your needs by customizing its dev environment, adding custom instructions, and MCP servers

Proactively performs security and quality analysis of code that it creates

Feedback without the wait

Iterate faster and get “ready to merge” instantly

- **Code Review:** an intelligent agent, reviewing your code from various angles—such as planning, customizing, and deduplicating—to systematically uncover insights, identify issues, and suggest fixes.
- **Code Quality:** Now in public preview, surface quality issues both in the pull request and the backlog to fix technical debt on your schedule.

Agent HQ: Any agent, any way you work

Public Preview

Unite every agent on a single platform

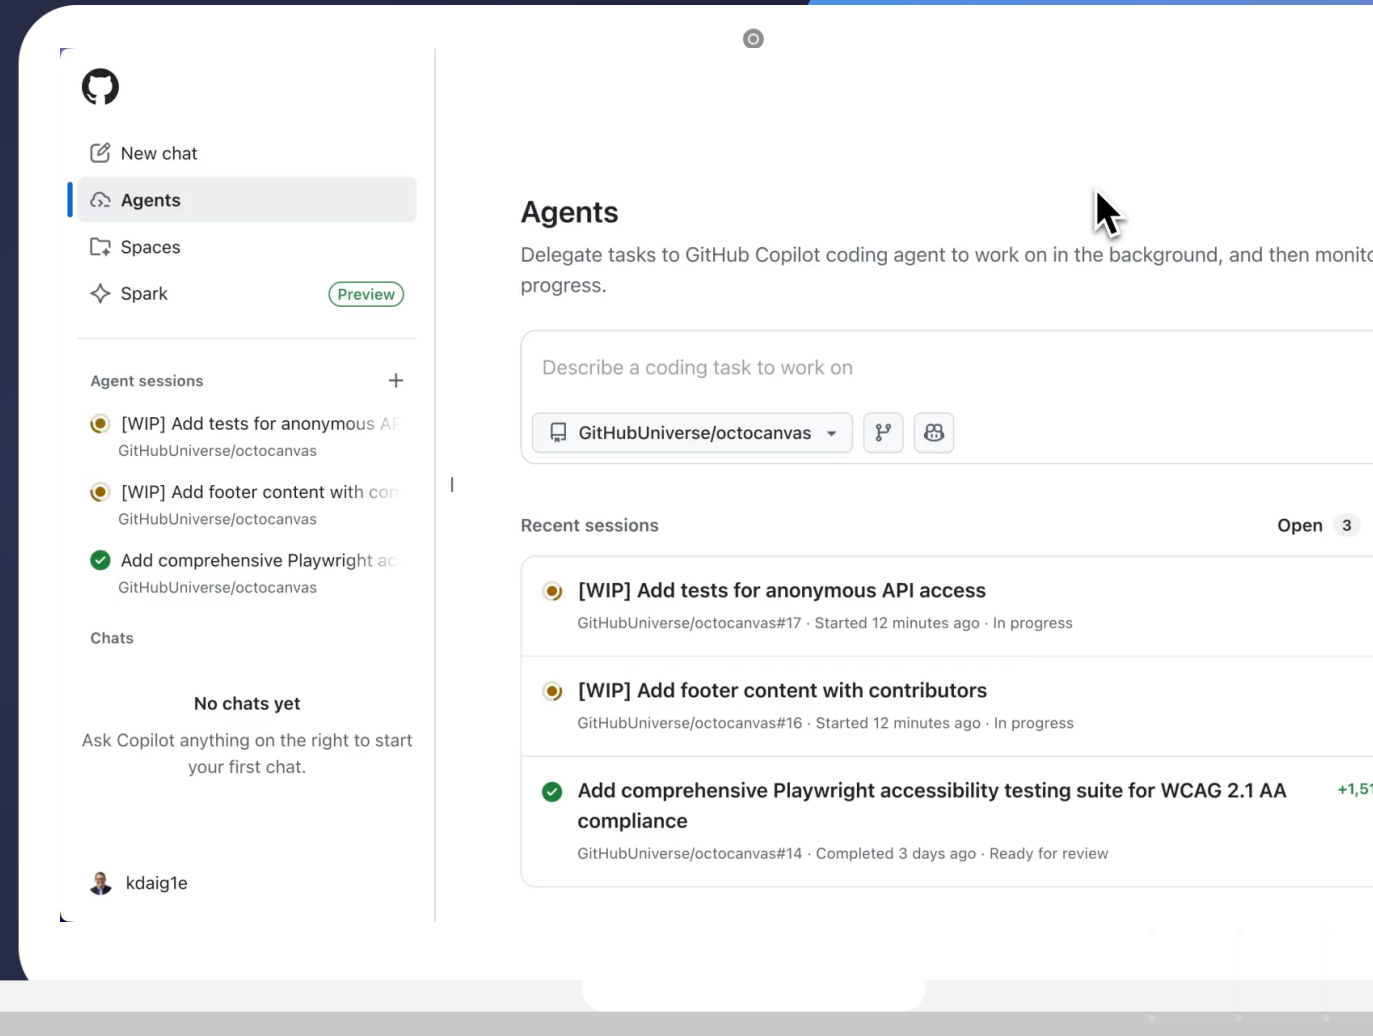

Coding agents from leading model providers directly within GitHub ecosystem

Leverage a single command center to assign, steer, and track multiple agents

Enterprise-grade functionality with agentic code review, control plane to govern AI access and agent behavior, and a metrics dashboard

GitHub Copilot: Custom Agents

Public Preview

Specialized versions of Copilot coding agent tailored for you

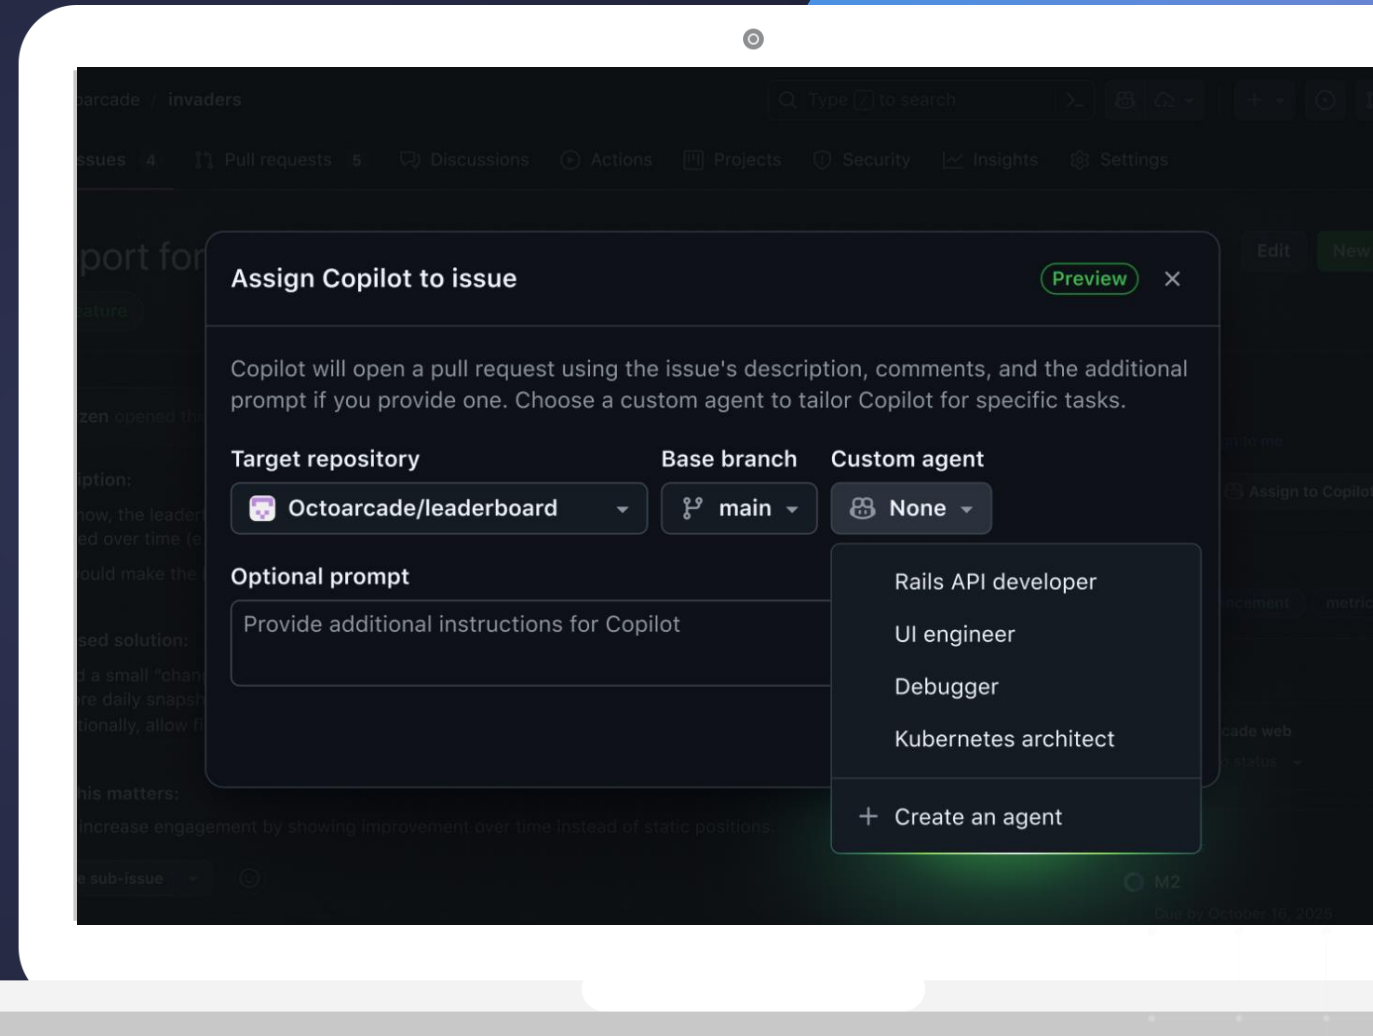

Tailor specialized agents to follow workflows, conventions, and use cases

Guide agents to outcomes through agent profiles that define their behavior

Specify prompts, tools, and MCP servers to be used in the agent's workflow

GitHub-native Copilot Metrics Dashboard

Public Preview

Track the who, where, and how of GitHub Copilot usage

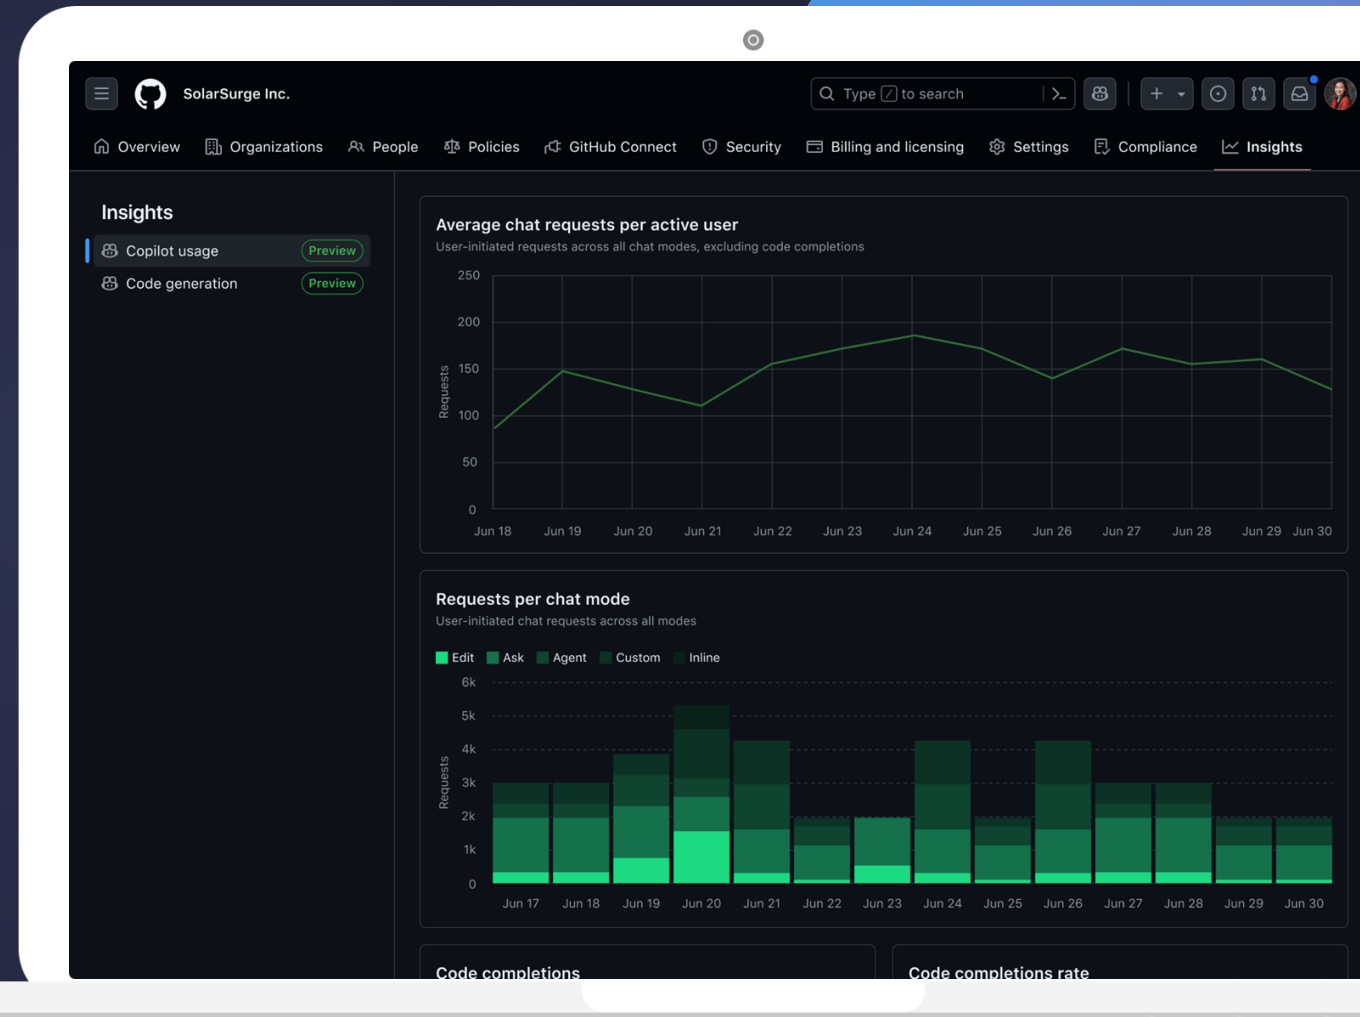

Aggregated enterprise-level insights in a pre-curated view for the last 28, 14, or 7 days

Granular, IDE metrics on usage for modes, models, and languages

Extend available metrics and filter to user-level via API or JSON download

*Please ensure IDEs are at latest version; outdated IDE versions not supported

Deploy web app to Azure using App Service or Azure Container Apps #30

Open patrick-vuong

Refresh

patrick-vuong commented 6 hours ago

Description

Deploy the Zava Smart Sportswear web application to Azure. Evaluate both Azure App Service and Azure Container Apps as deployment options, and document the process.

Tasks

- Assess suitability of Azure App Service for the project
- Assess suitability of Azure Container Apps for the project
- Prepare necessary configuration files and environment variables
- Update documentation with deployment instructions
- (Optional) Automate deployment using GitHub Actions or Azure DevOps pipelines

Acceptance Criteria

- The application is successfully deployed to Azure using at least one of the options (App Service or Container Apps)
- Documentation is updated to include step-by-step deployment instructions

Additional Notes

Consider costs, scalability, and ease of management when evaluating deployment options.

for this app should I do app service, azure container apps or app service

> Used 1 reference

✓ Optimizing tool selection...

I need to analyze your application to provide the best recommendation for Azure hosting. Let me first understand your project better and then use Azure tools to give you informed guidance.

Using "@azure summarize topic"

Input

```
{
  "intent": "Help user choose between App Service, Azure Container Apps, or App Service"
}
```

Output

Summarized topic:

Add Context...
Add context (#), external link, or file

Supercharge agentic workflows with MCP Servers

GitHub MCP Server

-  Automate GitHub Workflows and processes
-  Extract and analyze data from GitHub repositories
-  Build AI powered tools and applications that interact with GitHub's ecosystem
-  Create, manage, and update issues and pull requests

[Aka.ms/GitHubMCP](https://aka.ms/GitHubMCP)

Azure MCP Server

- Receive Azure best practices 
- Bolster GitHub Copilot with Azure context and resources 
- Tooling to interact with 40+ Azure Service areas 
- Connect with GitHub Copilot coding agent to extend capabilities

Azure SRE Agent

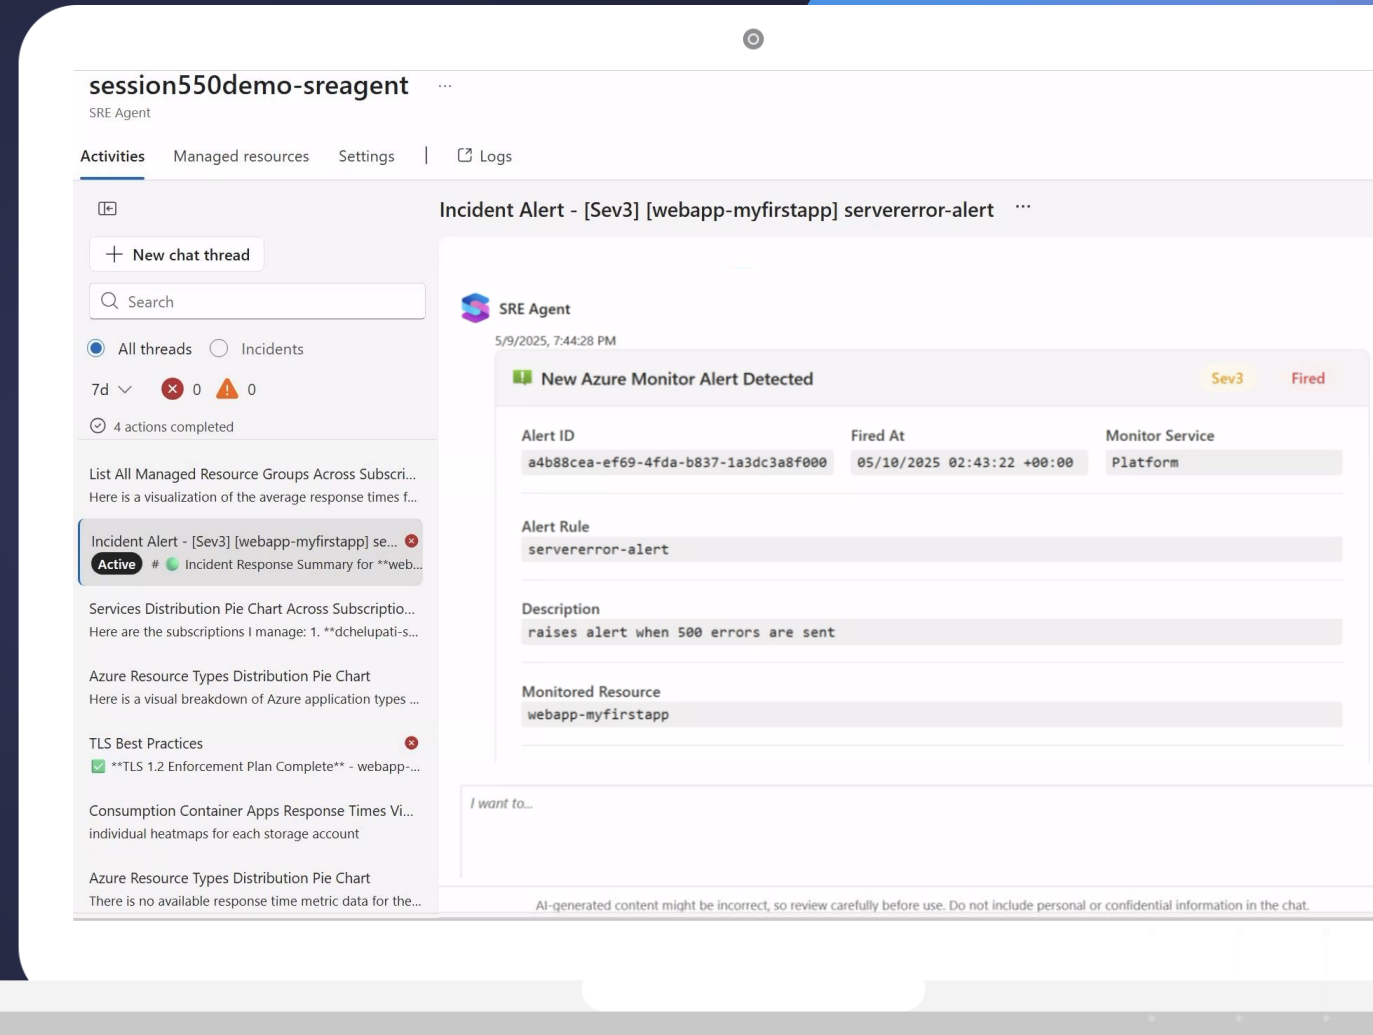

AI-powered incident management and resource optimization in production

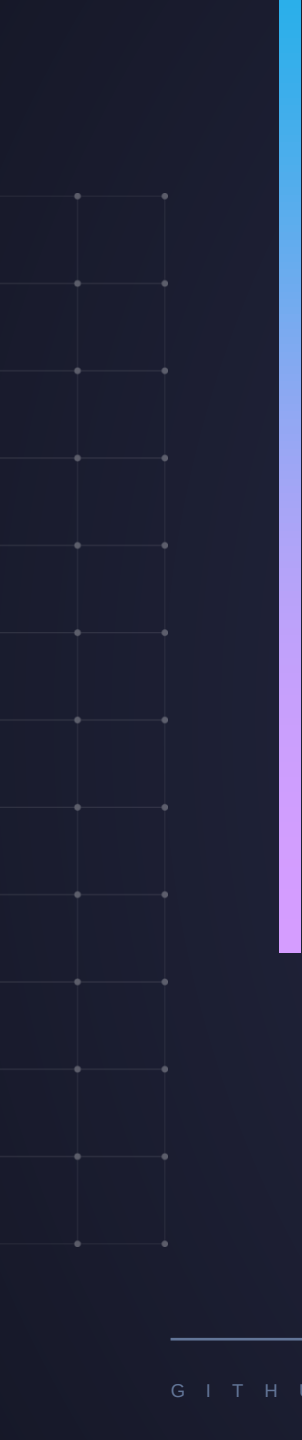

Automatic incident management reduces the number of pager alerts for human SREs

Proactive diagnosis and mitigation

Automated deployments and autonomous rollbacks

Continuous monitoring of health and performance of Azure resources

Getting Started with GitHub Copilot

GitHub Copilot Business

\$19 user / month

- ✓ Unlimited agent mode and chats with base model
- ✓ Unlimited code completions
- ✓ Access to code review
- ✓ Includes 300 premium requests per user per month
- ✓ User management and usage metrics
- ✓ IP indemnity and data privacy

GitHub Copilot Enterprise

\$39 user / month

- ✓ Everything in GitHub Copilot Business
- ✓ Access to all models, including Claude Opus 4, o3, and GPT-4.5
- ✓ Includes 1,000 premium requests per user per month
- ✓ Coding agent (preview)

Unlimited use of base model

Additional premium requests beyond entitlements at \$0.04 USD*

*Multipliers may apply for select premium models. See documentation for details

GitHub Copilot Adoption Stages

We recommend to first focus on your developers' adoption and engagement with Copilot. Then, harness developers' improved productivity to pursue the engineering system improvements that matter most to your organization

Maximize GitHub Copilot's Potential
